

Q.Explain the difference between justify-items and justify-self using code examples.

Certainly! justify-items and justify-self are both properties in CSS that are used in the context of grid and flexbox layouts, but they serve different purposes.

JUSTIFY-ITEMS

justify-items is used in a grid container to align the items within their grid areas along the inline (row) axis. It applies to all items in the grid.

JUSTIFY SELF

justify-self is used to align a specific item within its grid area. This property allows for individual control over the alignment of each item in the grid.
