Q. Explain the use of grid-auto-row and grid-auto-column using code examples.

Sure! In CSS Grid Layout, grid-auto-rows and grid-auto-column are properties used to control the size of implicit grid rows and columns. These properties define how rows and columns are created automatically when the explicit grid area is filled.

grid-auto-rows

The grid-auto-rows property sets the size of rows that are created automatically in a grid container. This comes into play when items are placed in the grid without specifying a row in an explicit grid.

grid-auto-column

The grid-auto-column property works similarly but for columns. It specifies the size of columns that are created automatically in the grid container.
